"Food is our common ground, a universal experience."

James Beard

SCRI is Scotland's leading centre for research on plants and the way they interact with farmland and the natural environment.

We have a world-wide reputation.

We are active in determining how genes regulate plant growth.

We are researching the quality, health and nutritional values of food. We are helping to control crop pests and diseases and we are studying the way plants relate to and modify their environment.

Our scientists are hard at work tackling the implications of climate change in Scotland. We are also developing new ways to use waste effectively on the land. We promote biodiversity and the science behind farmed habitats to farmers, schoolchildren, students and the general public.

We champion sustainable farming methods through our role as a LEAF Innovation Centre.

Mylnefield Research Services – our commercial subsidiary – takes SCRI knowledge and innovation to the market with our industrial partners.

The crop varieties we breed have resulted in 580 user-licences in 23 countries.

An independent, economic impact assessment* estimates that we generate £160 million of business every year in the farming, manufacturing and retail sectors in Scotland and the rest of the UK. That means public sector investment in SCRI is multiplied and put back in the economy by a factor of 14.
